# Voicepoint Helium®

Medical speech recognition for macOS

Voicepoint Helium® is a cloud-based medical speech recognition solution that we have developed for macOS. This product innovation is based on the proven Dragon technology from Nuance. The Voicepoint Helium® dictation application allows you to intuitively document your texts in the patient or clinic information system. Voicepoint Helium® connects to the Dragon Medical Server, which is installed in the secure and highly available Voicepoint Cloud, making your voice profile available on both Windows (via Dragon Medical One) and macOS. This means that you can access your user-specific terms, text modules and personal dictionary from both operating systems and regardless of your location. Voicepoint Helium® is installed and ready to use in no time. For maximum recognition accuracy right from the start, we also recommend the use of our medical vocabulary Voicepoint Argon® Lex.

Your benefits at a glance

Increased productivity, financial savings and massive time savings for you
Your employees spend less time on administrative tasks and have more resources for their core tasks.

Patients take centre stage
The application is available at their workplace, regardless of the location. This allows the medical profession to focus on treating and caring for patients.

Speed, precision and adaptability at all times
Benefit from fast and responsive speech recognition that delivers very high accuracy right from the start – including the recognition of different accents and in English, German, French and Italian. This enables you to create more detailed reports of higher quality in less time.

Voicepoint Helium® contains an extensive medical vocabulary, enabling efficient and accurate document creation. You can also supplement the software with the custom vocabulary Voicepoint Argon® Lex. By analysing your existing documents, the software is adapted precisely to your area of application, ensuring even greater recognition accuracy.

Voice commands and automation for even more time savings
Save valuable time by creating voice commands that you can use to automate numerous actions. Benefit from even more flexibility by assigning commands and actions to the dictation microphone buttons or by configuring and using customised keyboard shortcuts.

Simplified installation, use and management
Easy configuration, quick installation and updates: everything is designed to make the work of your IT and employees easier and to ensure a quick start-up – without the need for tedious language training. Voice-controlled data entry is done in the Voicepoint Helium® dictation window or directly in the practice/hospital information system and various macOS applications.

First-class protection with ISO certifications
We guarantee an enhanced level of protection through our ISO 27001 and 27701 certifications for information security and data protection.

Swissness is in our DNA
Our Voicepoint Cloud is hosted and managed in Switzerland and no data is transferred abroad.
